Application No.: 10/051,548 Docket No.: 106221-4

AMENDMENTS TO THE CLAIMS

1 to 114. Canceled

115 to 136. Canceled

137. (New) A system for determining a preferred segmentation for at least a first data set and a second data set, wherein each data set includes a plurality of elements and is segmented into a number of groups that is less than or equal to the number of elements, comprising:

- (A) one or more input devices for inputting the first and second data sets and association values representing an association between one or more elements of the first data set and one or more elements of the second data set; and
- (B) a data processing system having a processor operable to:
- (i) modify a segmentation of each of the first and second data sets to produce first and second modified data sets having different groups than the first and second data sets;
- (ii) calculate group association values based on the association values, the group association values indicating an association between groups of the first modified data set and groups of the second modified data set;
- (iii) calculate a metric based on the group association values, the metric representing a measure of an optimization of the segmentations;
- (iv) modify, where the metric represents an optimization below a desired level of optimization, the segmentation of at least one of the first and second data sets and recalculating group association values and the metric; and
- (v) output, where the metric represents an optimization level that equals or exceeds the desired level of optimization, the segmentation for the first and second data sets.

Application No.: 10/051,548 Docket No.: 106221-4

138. (New) The system of claim 137, wherein the first and second data sets are categorical data sets.

- 139. (New) The system of claim 138, wherein one of the first and second data sets represents customers.
- 140. (New) The system of claim 139, wherein a second one of the first and second data sets represents products.
- 141. (New) The system of claim 140, wherein the association values represent an association between customers and products.
- 142. (New) The system of claim 141, wherein the association values represent revenue.
- 143. (New) The system of claim 141, wherein the association values represent profit.
- 144. (New) The system of claim 143, wherein outputting the segmentation includes displaying a representation of the group association values.
- 145. (New) The method of claim 137, wherein (B)(i) comprises aggregating and the number of groups of the first modified data set is less than the number of groups of the first data set.
- 146. (New) The system of claim 137, wherein (B)(i) comprises refining and the number of groups of the first modified data set is greater than the number of groups of the first data set.
- 147. (New) The system of claim 137, wherein (B)(i) comprises both aggregating and refining.
- 148. (New) The system of claim 137, wherein the value of the metric is optimal with respect to a set of admissible functions of the first and second modified data sets.

Application No.: 10/051,548 Docket No.: 106221-4

149. (New) The system of claim 137, wherein (B)(iv) comprises determining whether any of the first and second modified data sets has converged.

- 150. (New) The system of claim 137, wherein (B)(iv) comprises determining whether a matrix defined by a cross-space of the first and second modified data sets has converged.
- 151. (New) The system of claim 137, wherein (B)(iv) comprises determining whether a function of a matrix defined by a cross-space of the first and second modified data sets has converged.
- 152. (New) The system of claim 151, wherein (B)(iv) further comprises determining whether an overall association value corresponding to an association between the first and second modified data sets has converged.
- 153. (New) The system of claim 137, wherein (B)(iv) comprises determining whether a permutation signifying an ordering of any of the first and second modified data sets has converged.
- 154. (New) The system of claim 137, wherein a matrix defined by a cross-space of the first and second data sets is populated with live data such that the matrix is dynamic.
- 155. (New) The system of claim 137, wherein (B)(iii) comprises calculating a value of a metric taken on a matrix, wherein the matrix defined by a cross-space formed by the first and second modified data sets and, wherein the metric is a linear arithmetic operation on a plurality of elements of the matrix.
- 156. (New) The system of claim 156, further comprising a computer display for outputting the segmentation, wherein outputting the segmentation includes displaying a representation of the group association values on the computer display.
 - 157. (New) The system of claim 157, wherein the display of a representation of the group association values takes the form of a cross-matrix defined by the first and second data sets.
